r/intellectualproperty - You avoid missing crucial prior art and save time by using Boolean search strings?

Help! I've spent hours trying to be really clever and the biggest pain point has been for creating prior art search strings. By now I've made myself constantly refining google search strings for the past 3 weeks. Patents USPTO help on Espacenet and I've asked several people but I can't seem to get it right. I've tried to catch everything. I've been looking at things with keywords and I'm thinking directly google the best use of a really good search engine. I've tried to use a lot of different search engines but I've been stuck. What's the best method for this?

Thread: 7 Tips for Flawless Patent Prior Art Search with AI

1/ Patent prior art search is complex. Missing key references can be costly. Here are 7 tips to level up your strategy, especially with AI. #PatentSearch #IPStrategy

2/ START with natural language. Describe your invention clearly. Don't immediately jump to Boolean. AI tools excel at extracting concepts from plain English.

3/ DIVERSIFY your databases. Google Patents is great, but don't stop there. USPTO, EPO, Espacenet offer unique coverage. A comprehensive search spans them all. #IPLaw

Article: Revolutionizing Patent Prior Art Search: The AI Advantage for IP Professionals

In the rapidly evolving landscape of intellectual property, the efficiency and accuracy of prior art searches remain paramount. Yet, for many patent attorneys, agents, and R&D teams, the process is often a time-consuming, manual endeavor, fraught with the complexities of crafting precise Boolean search strings across disparate databases. What if there was a way to bypass this painstaking process, generating robust, multi-tiered search strategies from a simple natural language description?
